-!- FUNCTION: Receptor for TNPSF13B/BLyS/BAFF and TNFSF13/APRIL.
-Promotes B-cell survival and plays a role in the regulation of humoral immunity. Activates NF-kappa-B and UNK (By similarity).
-!- SUBUNIT: Associates with TRAF1, TRAF2, TRAF3, TRAF5 and TRAF6.

TISSUE SPECIFICITY: Highly expressed in spleen and testis;
detected at lower levels in lung and thymus.
DISBASE: Defects in Thriffiz are a cause of severe B-cell
deficiency. B-cell deficient strain A/WySnJ has a 4.7 kb inserti.
in the BAFFR gene leading to an altered C-terminus. The mutant R is not detectable. B-cell lymphopoiesis is normal, but the life span of peripheral B-cells is much reduced.
SIMILARITY: Contains 1 TNRR-Cys repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Promotes the survival of mature B-cells and the B-cell response. -!- SUBCELLULAR LOCATION: Type III membrane protein (Probable). -!- ALTERNATIVE PRODUCTS:

                       (aspartate-specific cysteine proceases) mediating apoptosis. FAS-
mediated apoptosis may have a role in the induction of peripheral
tolerance, in the antigen-stimulated suicide of mature T-cells, or
both (By similarity).
-!- SUBGNIT: Binds DAXX and RIPK1 (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- DOMAIN: Contains a death domain involved in the binding of FADD,
and maybe to other cytosolic adaptor proteins.
-!- SIMILARITY: Contains 1 Take Contains 3 TNFR-Cys repeats.

TISSUE SPECIFICITY: Highly expressed in spleen and lymph node, and
in resting B-cells. Detected at lower levels in activated B-cells,
resting CD4+ T-cells, in thymus and peripheral blood leukocytes.
SIMILARITY: Contains I TNPR-Cys repeat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Yan M., Brady J.R., Chan B., Lee W.P., Hsu B., Harless S.M., Cancro M.P., Grewal I.S., Dixit V.M.;

"Identification of a novel receptor teo B lymphocyte stimulator that is mutated in a mouse strain with severe B cell deficiency.";

Curr. Biol. 11:1547-1552(2001).

-!- PUNCTION: B-cell receptor specific for TNFSF13B/TALLI/BAFF/BLyS.

Promotes the survival of mature B-cells and the B-cell response.
-: SUBCELLULAR LOCATION: Type III membrane protein (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "BAPP-R, a newly identified TNF receptor that specifically interacts with BAFP.",
                                                                                                                                                                                                                                                                  28-FEB-2003 (Rel. 41, Last sequence update)

-: FUNCTION: Part of a binding-protein-dependent transport system.

Probably responsible for the translocation of the substrate across

the membrane (By similarity).

-: SUMILARITY: Belongs to the binding-protein-dependent transport

"Nephrocystin interacts with Pyk2, p130(Cas), and tensin and triggers phosphorylation of Pyk2.";

Proc. Natl. Acad. Sci. U.S.A. 98:9784-9789(2001).

"I FONCTION: Involved in calcium induced regulation of ion channel and activation of the map kinase signaling pathway. May represent an important signaling intermediate between meuropeptide activated receptors or neurotransmitters that increase calcium flux and the calcium flux and the regulate neuronal activity. Interacts with the Standard protein KV1.2. Its activation is highly correlated with the Stimulation of c-Jun N-terminal kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Avraham S., London R., Fu Y., Ota S., Hiregowdara D., Li J., Jiang S., Pagztor L.M., White R.A., Groopman J.E., Avraham H.; "Identification and characterization of a novel related adhesion focal tyrosine kinase (RAFTK) from megakaryocytes and brain."; J. Xiong W.-C., Macklem M., Parsons J.T.;

Repression and characterization of splice variants of PYK2, a focal adhesion kinase-related protein.";

J. Cell Sci. 111:1981-1991(1998).

J. Cell Sci. 111:1981-1991(1998).

J. Cell Sci. 111:1081 and activation of ion channel and activation of the map kinase signaling pathway. May represent an important signaling intermediate between neuropeptide activated receptors or neurotransmitters that increase calcium flux and the commercem signals that regulate neuronal activity. Interacts with the Styl domain of Grbz. May phosphorylate the voltage-gated potassium channel protein NV1.2. Its activation is highly correlated with the stimulation of c-Jun N-terminal kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. Name=3; Synonyms=PRUK2;
Isold=P70600-2; Sequence=VSP_004984;
Isold=P70600-3; Sequence=VSP_004984;
TISSUE SPECIFICITY: Isoform 1 is expressed at high levels in the brain (hippocampus, cerebral cortex and olfactory bulb) and poorly in the spleen and other tissues, whereas isoforms 2 and 3 are expressed in the spleen and brain (hiphest in cerebellum).
PTM: Phosphorylated on tyrosine residues in response to various etimuli that elevate the intracellular calcium concentration, as well as by PKC activation. Recruitment by Nephrocystin to cell matrix adhesions initiates Tyr-402 phosphorylation (By emitiates Tyr-402 phosphorylation (By emitiates)
                                                                                                                                                                                                                                                                                                                                                                                                                                    tyrosine phosphate. SUBUNIT: Interacts with PTPNS1 and DDEF2 (By similarity). Isoform
                                                                                                                                                                                                                                                                                                                                                                                                                                                            1, but not isotomm 2, interacts with Crk-associated substrate (Cas), Nephrocystin and OPHNIL.
SUBCELLULAR LOCATION: Cytoplasmic. Interaction with Nephrocystin induces the membrane-association of the kinase (By similarity). Isoform 2 localizes to focal adhesions, but not isoforms 1 and 3. ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            similarity). In monocytes, adherence to substrata is required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tyrosine phosphorylation and kinase activation. Angiotensin II, thapsigargin and L-alpha-lysophosphatidic acid (LPA) also induce autophosphorylation and increase kinase activity. SIMILARITY: Belongs to the Tyr family of protein kinases. FAK

Proc. Natl. Acad. Sci. Us.A. 100:443-448 (2003).

InvOlved in calcium induced regulation of ion channel and activation of the map kinase signaling pathway. May represent an important signaling intermediate between neuropeptide activated receptors or neurotransmitters that increase calcium flux and the downstream signals that regulate neuronal activity. Interacts with the SH2 domain of Grb2. May phosphorylate the voltage-gated potassium channel protein KV1.2. Its activation is highly correlated with the stimulation of c-Jun N-terminal kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Andreev J., Simon J.-P., Sabatini D.D., Kam J., Plowman G.,

-1-TISSUE SPECIFICITY: Most abundant in the brain, with highest levels in anyddala and hippocampus. Low levels in Kidney. Also expressed in spleen and hippocampus. Low levels in Kidney. Also expressed in spleen and hippocampus. Low levels in Kidney. Also expressed in spleen and hippocampus. Low levels in kidney. Also stimuli that elevate the intracellular calcium concentration, as well as by PKC activation. Recruitment by Nephrocystin to cell matrix adhesions initiates Tyr-402 phosphorylation. In monocytes, adherence to substrata is required for tyrosine phosphorylation and kinase activation. Angiotensin II, thapsigargin and L-alphalysophosphatidic acid (LPA) also induce autophosphorylation and increase kinase activity (By similarity).
-!- SIMILARITY: Belongs to the Tyr family of protein kinases. FAK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MIM, 601212; -. Mediates calcineurin-dependent activation of NF-AT, as well as activation of NF-AT, as well as activation of NF-Rapas B and AP-1. Involved in the similation of B- and T-cell function and the regulation of humoral immunity.

-!- SUBUNIT: Binds TRAP2, TRAF5 and TRAF6. Binds the NH2-terminal domain of CAMLG with its C-terminus.

-!- SUBCELLULAR LOCATION: Type III membrane protein.

-!- TISSUB SPECIFICITY: Highly expressed in spleen, thymus, small intestine and peripheral blood leukocytes. Expressed in resting·B-cells and activated T-cells, but not in resting T-cells.

-!- SIMILARITY: Contains 2 TRRE-Cys repeats.

-!- CAUTION: It is uncertain whether Met-1 or Met-31 is the initiator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=20341628; PubMed=10880535; MEDLINE=20341628; PubMed=10880535; MEDLINE=20341628; PubMed=10880535; Mia X.-Z., Treanor J., Senaldi G., Khare S.D., Boone T., Kelley M., Theill L.E., Colombero A., Solovyev I., Lee F., McCabe S., Elliott R., Miner K., Hawkins N., Guo J., Stolina M., Yu G., Wang J., Delaney J., Meng S.Y., Boyle W.J., Hsu H.; Meng S.Y., Boyle W.J., Hsu H.; Ecceptor for TALL-1, a tumor necrosis factor family member involved in B cell regulation."; J. Exp. Med. 192:137-143(2000).

"MjKL, a K+ Channel from M. jannaschii, mediates K+ uptake and R
sensitivity in B. coli.";
FEBS Lett. 547:165-169(2003).
-!- FWOKTION: Probable potassium channel protein.
-!- SUNCELULAR LOCATION: Integral membrane protein (Probable).
-!- SIMILARITY: Contains 1 trkA/RCK domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8.1%; Score 78.5; DB 2; Length 314; 30.4%; Pred.
